General Information Regarding Anesthesia

Anesthesia - We use the same safe Isoflurane gas that is often used in human medicine.

Monitoring- Your pet is closely monitored throughout the entire procedure/anesthesia. Your pet's temperature, heart rate and rhythm, respirations, and oxygen levels are continuously checked by our staff and anesthetic monitoring equipment.

Intravenous catheter with fluids-Intravenous fluids help your pet recover more quickly from anesthesia, maintains blood pressure, and increases circulation during anesthesia. The intravenous catheter is also used to administer medications if needed.

I verify I am the owner (or Authorized agent for the owner) of the above named pet and authorize the above procedure to be performed. I authorize the use of anesthesia and other medication as deemed necessary by the Veterinarian and understand that hospital personnel will be employed in the procedure(s) as directed by the veterinarian. I have been advised as to the nature of this procedure to be performed and the risks involved. I understand also that there is always a risk associated with any anesthesia episode, even in apparently healthy animals and have discussed my concerns with the veterinarian. I understand that it may be necessary to provide medical and/or surgical procedures which are not anticipated for the safety or care of my pet. I hereby consent to and authorize the performance of such altered and/or additional procedures as are necessary in the veterinarian's professional judgement. I accept responsibility for any result in additional charges. I agree to be responsible for any charges incurred while my pet is in the care of this facility and understand payment is due at the time my pet is released from the hospital. I understand no staff will be attending to my pet overnight (pets needing special care may be referred to a 24 hour hospital).

What You Need to Know Before Your Pet's Upcoming Surgery

Many people have questions about various aspects of their pet's surgery, and we hope this information will help. It also explains the decisions you will need to make before your pet's upcoming surgery.

Is the anesthetic safe?

Today's modern anesthetic monitors have made surgery much safer than in the past. Here at Village Veterinary Center we do a thorough physical exam on your pet before administering anesthetics, to ensure that a fever or other illness won't be a problem. We also adjust the amount and type of anesthetic used depending on the health of your pet. Pre-anesthetic blood testing is important in reducing the risk of anesthesia. Every pet needs blood testing before surgery to ensure that the liver and kidneys can handle the anesthetic. Even apparently healthy animals can have serious organ system problems that cannot be detected without blood testing. If there is a problem, it is much better to find it before it causes anesthetic or surgical complications. Animals that have minor dysfunctions will handle the anesthetic better if they receive IV fluids during surgery. If serious problems are detected, surgery can be postponed until the problem is corrected.

We offer in-house blood testing before surgery, which we will go over with you when you bring your pet in. Our doctors prefer the more comprehensive screen, because it gives them the most information to ensure the safety of your pet. For geriatric or ill pets, additional blood tests, electrocardiograms, or x-rays may be required before surgery as well. It is important that surgery be done on an empty stomach to reduce the risk of vomiting during and after anesthesia. You will need to withhold food from 6PM the night before surgery. Water can be left down for the pet until the morning of surgery.

Will my pet have stitches?

For many surgeries, we use absorbable sutures underneath the skin. These will dissolve on their own, and do not need to be removed later. Some surgeries, especially tumor removals, do require skin sutures. With either type of suture, you will need to keep an eye on the incision for swelling or discharge. Most dogs and cats do not lick excessively or chew at the incision, but this is an occasional problem you will also need to watch for. If there are skin sutures, these will usually be removed 10 to 14 days after surgery. You will also need to limit your pet's activity level for a time and no baths are allowed for the first 10 days after surgery.

Will my pet be in pain?

Anything that causes pain in people can be expected to cause pain in animals. Pets may not show the same symptoms of pain as people do; they usually don't whine or cry, but you can be sure they feel it. Pain medications needed will depend on the surgery performed. Major procedures require more pain relief than things like minor lacerations.

For dogs, we may recommend an oral anti-inflammatory the day after surgery and several days after to lessen the risk of discomfort and swelling. We use newer medications, which are less likely to cause stomach upset and can be given even the morning of surgery.

Because cats do not tolerate standard pain medications such as aspirin, ibuprofen, or Tylenol, we are limited in what we can give them. Recent advances in pain medications have allowed for better pain control in cats than ever before. We administer a pain injection 10 minutes prior to surgery. After surgery, pain medication is given on a case by case basis. Any animal that appears painful will receive additional pain medication.

Injectable pain medications may also be used after surgery on both dogs and cats. Providing whatever pain relief is appropriate is a humane and caring thing to do for your pet.

What other decisions do I need to make?

While your pet is under anesthesia, it is the ideal time to perform other minor procedures, such as dentistry, ear cleaning, or implanting an identification microchip. If you would like an estimate for these extra services, please call ahead of time. This is especially important if the person dropping the pet off for surgery is not the primary decision maker for the pet's care.
